### An Infinite State System

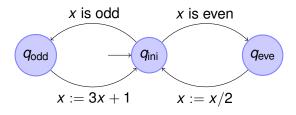

Figure: Syracuse

DQC

< □ > < □ > < □ > < □ > < □ >

In this presentation, we consider counter systems:

- A finite set of counter variables.
- A finite control structure (a finite graph).
- Labelled with actions manipulating the variable contents.

Good model:

- C programs, expect system calls, heap manipulations, recursive calls, floating point arithmetic operations...
- C programs manipulating linked data structures [BBH+06].
- Abstraction of communicating processes [BCR01], [BMWK09].

200

く 同 ト く ヨ ト く ヨ ト

# The safety verification problem

**Input** : An initial and a final configuration. **Decide** : if the final configuration is reachable from the initial one.

Some remarks:

- The problem is recursively-countable : we prove the reachability with a path.
- The problem is not recursive : we prove the non-reachability with an inductive invariant that contains the initial configuration but not the final configuration.

The big problem:

- Find out a "good" logic (expressive, decidable) to express invariants.
- Find out a way for computing an invariant in this logic.

## Grammar

 $FO(\mathbb{N},+,0,1)$ 

Let X be a countable set of variables.

Definition (Presburger Formulas)

$$\begin{array}{l} t := 0 \mid 1 \mid x \mid t_{1} + t_{2} \\ p := t_{1} = t_{2} \mid \top \mid \bot \\ \phi := p \mid \neg \phi \mid \phi_{1} \lor \phi_{2} \mid \phi_{1} \land \phi_{2} \mid \exists x \phi \mid \forall x \phi \end{array}$$

with  $x \in X$ 

Examples:

- Even numbers :  $\exists y \ x = y + y$
- Odd numbers :  $\exists y x + 1 = y + y$

不良 トイヨト イヨト

## **Term Variables**

#### Definition

 $var(t) \subseteq X$  is the set of variables of a term t.

$$var(0) = \emptyset$$
  

$$var(1) = \emptyset$$
  

$$var(x) = \{x\}$$
  

$$var(t_1 + t_2) = var(t_1) \cup var(t_2)$$

$$\operatorname{var}(x+y) = \{x, y\}.$$

590

<ロト < 回ト < 回ト < ヨト < ヨト

# Free Variables

#### Definition

 $var(\phi) \subseteq X$  is the set of variables of a Presburger formula  $\phi$ .

$$\operatorname{var}(t_1 = t_2) = \operatorname{var}(t_1) \cup \operatorname{var}(t_2)$$
$$\operatorname{var}(\top) = \emptyset$$
$$\operatorname{var}(\bot) = \emptyset$$
$$\operatorname{var}(\neg \phi) = \operatorname{var}(\phi)$$
$$\operatorname{var}(\phi_1 \lor \phi_2) = \operatorname{var}(\phi_1) \cup \operatorname{var}(\phi_2)$$
$$\operatorname{var}(\phi_1 \land \phi_2) = \operatorname{var}(\phi_1) \cup \operatorname{var}(\phi_2)$$
$$\operatorname{var}(\exists x \phi) = \operatorname{var}(\phi) \setminus \{x\}$$
$$\operatorname{var}(\forall x \phi) = \operatorname{var}(\phi) \setminus \{x\}$$

$$\operatorname{var}(x = y + y) = \{x, y\}$$

 $var(x = x) = \{x\}$ 

$$\operatorname{var}(\exists y \, x = y + y) = \{x\}$$

イロト イポト イヨト イヨト 二日

# Valuations

#### Definition

A valuation v is a total function  $v : X \mapsto \mathbb{N}$ . v(t) is the valuation of a term t.

$$v(0) = 0$$
  
 $v(1) = 1$   
 $v(t_1 + t_2) = v(t_1) + v(t_2)$ 

For instance if t = 1 + (x + (x + y)) then:

$$v(t) = 1 + 2v(x) + v(y)$$

<ロト < 回ト < 回ト < ヨト < ヨト

## Models

 $v \models \phi$  is defined by induction.

$$v \models t_1 = t_2 \text{ iff } v(t_1) = v(t_2)$$

$$v \models \top$$

$$v \not\models \bot$$

$$v \models \neg \phi \text{ iff } v \not\models \phi$$

$$v \models \phi_1 \lor \phi_2 \text{ iff } v \models \phi_1 \text{ or } v \models \phi_2$$

$$v \models \phi_1 \land \phi_2 \text{ iff } v \models \phi_1 \text{ and } v \models \phi_2$$

$$v \models \exists x \phi \text{ iff } \exists n \in \mathbb{N} \text{ such that } v[x \mapsto n] \models \phi$$

$$v \models \forall x \phi \text{ iff } \forall n \in \mathbb{N} \text{ we have } v[x \mapsto n] \models \phi$$

DQC

< □ > < □ > < □ > < □ > < □ >

### Presburger Sets

Let  $\vec{x} = (x_1, \dots, x_d)$  be a vector of distinct variables. Let  $v(\vec{x}) = (v(x_1), \dots, v(x_d))$ .

#### Definition

A set  $S \subseteq \mathbb{N}^d$  is said to be denoted by  $\phi(\vec{x})$  where  $\phi$  is a Presburger formula with  $var(\phi) \subseteq \{x_1, \ldots, x_d\}$  if:

$$S = \{ \mathbf{v}(\vec{\mathbf{x}}) \mid \mathbf{v} \models \phi \}$$

In this case *S* is called a Presburger set.

・ 同 ト ・ ヨ ト ・ ヨ ト

### Presburger Sets : Linear Constraints

$$\{\vec{n} \in \mathbb{N}^2 \mid n_1 \le n_2\}$$
 is denoted by  $\phi(x_1, x_2)$  with:  
 $\phi = \exists y x_1 + y = x_2$ 

Let 
$$\alpha_1, \ldots, \alpha_d \in \mathbb{Z}$$
 and  $\beta \in \mathbb{Z}$ .  
 $\{\vec{n} \in \mathbb{N}^d \mid \alpha_1 n_1 + \cdots + \alpha_d n_d \leq \beta\}$  is a Presburger set.

DQC

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

### Presburger Sets : Divisibility Constraints

 $z_1 \sim_m z_2$  if *m* divides  $z_1 - z_2$ .

 $\{n \in \mathbb{N} \mid n \sim_2 0\}$  is denoted by  $\phi(x)$  with:  $\phi = \exists y \ x = y + y$ 

Let  $\alpha_1, \ldots, \alpha_d \in \mathbb{Z}, \beta \in \mathbb{Z}$  and  $m \in \mathbb{N}_{>0}$ .  $\{\vec{n} \in \mathbb{N}^d \mid \alpha_1 n_1 + \cdots + \alpha_d n_d \sim_m \beta\}$  is a Presburger set.

イロト イポト イヨト イヨト 二日

## **Quantifier Elimination**

$$\begin{array}{l} \mathsf{FO}\left(\mathbb{N},+,0,1,\leq,(\sim_{m})_{m\in\mathbb{N}>0}\right) \\ t \ := \ 0 \ | \ 1 \ | \ x \ | \ t_{1} + t_{2} \\ p \ := \ t_{1} = t_{2} \ | \ t_{1} \leq t_{2} \ | \ t_{1} \sim_{m} t_{2} \ | \ \top \ | \ \bot \\ \phi \ := \ p \ | \ \neg \phi \ | \ \phi_{1} \lor \phi_{2} \ | \ \phi_{1} \land \phi_{2} \ | \ \exists x \ \phi \ | \ \forall x \ \phi \end{array}$$

#### **Definition (Equivalence)**

 $\phi_1 \equiv \phi_2$  iff for every valuation *v* we have  $v \models \phi_1$  iff  $v \models \phi_2$ .

#### Theorem ([Pre29])

Any Presburger formula is effectively equivalent to a quantifier-free formula in FO  $(\mathbb{N}, +, 0, 1, \leq, (\sim_m)_{m \in \mathbb{N}_{>0}})$ 

\* 同 ト \* ヨ ト \* ヨ ト - -

# Satisfiability Problem

#### Definition (Satisfiability)

 $\phi$  satisfiable if  $v \models \phi$  for at least one valuation v

Theorem ([Ber77])

The satisfiability problem for the Presburger arithmetic is complete for the class of problems decidable by alternating Turing machines working in 2-EXPTIME with at most n alternations.

The satisfiability problem is decidable in 2-EXPSPACE.

・ロト ・ 同ト ・ ヨト ・ ヨト

## Semilinear Sets

#### Definition (Linear sets)

 $\{\vec{v_0} + n_1\vec{v_1} + \dots + n_k\vec{v_k} \mid n_1, \dots, n_k \in \mathbb{N}\}$ with  $\vec{v_0}, \dots, \vec{v_k} \in \mathbb{N}^d$ .

Figure: 
$$\vec{v_0} = (1,0), \, \vec{v_1} = (1,1), \, \vec{v_2} = (0,2)$$

Definition (Semilinear sets) Finite union of linear sets.

Theorem ([GS66])

A set is Presburger iff it is semilinear.

Jérôme Leroux (LaBRI)

# Outline

1) Presburger Arithmetic

#### 2 Formulas to Automata

- 3 Automata to Formulas
- 4 Presburger Counter Systems Reachability Problem

#### 5 Conclusion

Sac

• • • • • • • •

## Presburger Formulas vs Automata

Presburger formulas (for denoting Presburger sets):

- Lack canonical representations.
- Simplification procedure difficult.

Deterministic automata (for recognizing regular languages):

- Unique minimal deterministic automaton.
- $n \log(n)$  minimization procedure.

## **Binary Decomposition**

#### Definition

A word  $\sigma = a_1 \dots a_k$  with  $a_i \in \{0, 1\}$  such that:

$$n=a_12^0+\cdots+a_k2^{k-1}$$

<ロト < 回 ト < 注 ト < 注 ト - < 三 ト - < □ ト - < □ ト - < □ ト - < □ ト - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ - < □ -

A base of decomposition  $r \in \mathbb{N}_{>1}$ The digit alphabet  $\Sigma_r = \{0, \dots, r-1\}$ 

Definition (Encodings for  $\mathbb{N}$  in basis r) A word  $\sigma = a_1 \dots a_k$  with  $a_j \in \Sigma_r$  such that:

$$n = a_1 r^0 + \cdots + a_k r^{k-1}$$

イロト イポト イヨト イヨト

#### Extension : vectors

A dimension  $d \in \mathbb{N}$ . The *digit-vector alphabet*  $\Sigma_{r,d} = \Sigma_r^d$ 

Definition (Encodings for  $\mathbb{N}^d$ ) A word  $\sigma = \vec{a_1} \dots \vec{a_k}$  with  $\vec{a_j} \in \Sigma_{r,d}$  such that:

$$n = \vec{a_1}r^0 + \cdots + \vec{a_k}r^{k-1}$$

・ 同 ト ・ ヨ ト ・ ヨ ト

# Sets Recognizable in Base r

Definition

A set  $S \subseteq \mathbb{N}^d$  is encoded by a language  $L \subseteq \Sigma_{r,d}^*$  if S is the set of vectors  $\vec{n} \in \mathbb{N}^d$  with at least one encoding  $\sigma \in L$ .

If L is regular, S is said to be recognizable in base r.

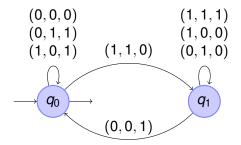

Figure:  $\{\vec{n} \in \mathbb{N}^3 \mid n_1 + n_2 = n_3\}$ 

Jérôme Leroux (LaBRI)

Presburger And Verification

MOVEP'10 23 / 68

# Saturated Languages

If  $S_1, S_2$  are encoded by languages  $L_1, L_2$ Then  $S_1 \cup S_2$  is encoded by  $L_1 \cup L_2$ But  $S_1 \cap S_2$  is not encoded by  $L_1 \cap L_2$ 

For instance 
$$L_1 = \{0\}$$
 and  $L_2 = \{0.0\}$ .  
Then  $S_1 = S_2 = \{0\} = S_1 \cap S_2$   
but  $L_1 \cap L_2 = \emptyset$ .

#### Definition (Saturated)

 $L \subseteq \sum_{r,d}^*$  such that for every encodings  $\sigma_1, \sigma_2$  of the same vector  $\vec{n}$ :

$$\sigma_1 \in L \iff \sigma_2 \in L$$

#### Lemma

Every set  $S \subseteq \mathbb{N}^d$  is encoded by a **unique** saturated language  $L \subseteq \Sigma_{r,d}^*$ .

Jérôme Leroux (LaBRI)

MOVEP'10 24/68

・ロト ・ 四ト ・ ヨト ・ ヨト

#### Saturation Procedure

#### Lemma

if X is encoded by L then X is encoded by the saturated language:

$$\bigcup_{i\in\mathbb{N}}L\cdot(0^i)^{-1}\cdot0^*$$

In particular this language is regular if L is regular.

∃ > ∢

### **Boolean Operations**

Let  $S_1, S_2, S$  be encoded by the saturated languages  $L_1, L_2, L$ 

 $S_1 \cup S_2$  is encoded by the saturated language  $L_1 \cup L_2$  $S_1 \cap S_2$  is encoded by the saturated language  $L_1 \cap L_2$  $\mathbb{N}^d \setminus S$  is encoded by the saturated language  $\sum_{r,d}^* \setminus L$ 

#### Lemma

The class of subsets of  $\mathbb{N}^d$  recognizable in base r is stable by union, intersection, and complement.

200

イボト イヨト イヨト

# Projection

$$\begin{array}{rcccc} \pi_i & : & \mathbb{N}^d & \to & \mathbb{N}^{d-1} \\ & & \vec{n} & \mapsto & (n_1, \dots, n_{i-1}, n_{i+1}, \dots, n_d) \end{array}$$

#### Lemma

Let  $X \subseteq \mathbb{N}^d$  encoded by  $L \subseteq \Sigma^*_{r,d}$ . Then  $\pi_i(X)$  is encoded by:

$$\{\pi_i(a_1)\cdots\pi_i(a_k)\mid a_1\ldots a_k\in L\}$$

In particular the language is regular if L is regular.

イロト イロト イヨト

## Presburger Automata

#### Theorem ([Cob69], [Kla04],[DGH10])

Every Presburger set is recognizable in base r. Moreover, the set denoted by  $\phi(\vec{x})$  can be encoded by a deterministic automaton in 3-EXPTIME.

#### Efficient algorithms for:

- Iinear constraints.
- divisibility constraints.
- can be found in [WB95].

### What Are The Recognizable Sets ?

 $r^* = \{r^n \mid n \in \mathbb{N}\}$  is encoded by  $L = 0^*.1$ .

Thus any set in FO  $(\mathbb{N}, +, 0, 1, r^*)$  is recognizable in base *r*.

イロト イロト イヨト イヨト

## Valuation Function

#### Definition

The valuation function  $V_r : \mathbb{N} \mapsto r^*$  is defined over any  $n \in \mathbb{N}_{>0}$  by:  $V_r(n)$  is the greatest integer in  $r^*$  that divides n

 $\{(n, V_r(n)) \mid n \in \mathbb{N} \setminus \{0\}\}$  is encoded by:

$$L = (0,0)^* \cdot \bigcup_{b \neq 0} (b,1) \cdot \Sigma^*_{r,2}$$

米田 トイヨト イヨト

## Characterization

#### Theorem ([BHMV94])

A set is recognizable in base r if and only if it is definable in FO  $(\mathbb{N}, +, 0, 1, V_r)$ .

Moreover, the set denoted by  $\phi(\vec{x})$  can be encoded by a deterministic automaton in time:

 $2^{2^{-1}}$  a tower of height *n*.

# Sets Recognizable in Multiple Basis

Observe that if  $S \subseteq \mathbb{N}^d$  is recognizable in basis *r* then it is recognizable in basis *r*<sup>n</sup> for every  $n \in \mathbb{N}_{>0}$ .

#### Definition (Multiplicatively dependant)

 $r_1, r_2 \in \mathbb{N}_{>1}$  are multiplicatively dependant if there exists  $n_1, n_2 \in \mathbb{N}_{>0}$  such that  $r_1^{n_1} = r_2^{n_2}$ 

#### Lemma

Let  $r_1, r_2 \in \mathbb{N}_{>1}$  be multiplicatively dependent basis of decomposition. A set is recognizable in base  $r_1$  iff it is recognizable in base  $r_2$ .

#### Theorem ([Cob69],[Sem77])

Let  $r_1, r_2 \in \mathbb{N}_{>1}$  be multiplicatively independant basis of decomposition. A set is recognizable in basis  $r_1$  and  $r_2$  iff it is Presburger.

## **Ultimately Periodic Sets**

#### Definition

A set  $S \subseteq \mathbb{N}$  is ultimately periodic if

```
\exists k \exists m \geq 1 \land (\forall n \geq k \Rightarrow (n \in S \Leftrightarrow n + m \in S))
```

is equivalent to  $\top$ .

A set  $S \subseteq \mathbb{N}$  is Presburger iff it is ultimately periodic (based on quantifier elimination).

イロト イポト イヨト イヨト

## Muchnik Criterion

Theorem ([Muc03])

Let  $d \in \mathbb{N}$  and let  $P_d$  be an uninterpreted symbol of dimension d.

We can effectively compute a formula  $\psi_d$  in FO ( $\mathbb{N}, +, 0, 1, P_d$ ) such that the formula  $\psi_d$  is equivalent to  $\top$  when  $P_d$  is interpreted as a set  $S \subseteq \mathbb{N}^d$  iff S is Presburger.

< 🗇 🕨 < 🖃 🕨 <

Presburger Synthesis:

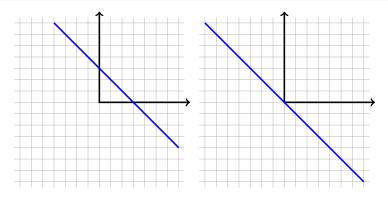

- An EXPTIME algorithm for Boolean combinations of linear equalities [Ler03].
- An EXPTIME algorithm for conjunctions of inequalities [Lat04].
- An 2-EXPTIME algorithm for sets  $B + P^*$  where B, P finite [Lug04].
- A PTIME algorithm for the full Presburger arithmetic [Ler05].

# Affine Spaces

#### Definition (Affine spaces)

A non-empty subset A of  $\mathbb{Q}^d$  satisfying a conjunction of linear equalities. Its direction  $\vec{A}$  is the subset of  $\mathbb{Q}^n$  satisfying the *homogeneous* conjunction.

#### Figure: An affine space and its direction

Jérôme Leroux (LaBRI)

Presburger And Verification

MOVEP'10 38 / 68

# Semi-Affine spaces

#### Definition (Semi-affine spaces[Ler04])

A finite union  $S = \bigcup_{i=1}^{k} A_i$  of non-empty affine spaces  $A_i$ . Its direction  $\vec{S} = \bigcup_{i=1}^{k} \vec{A_i}$ .

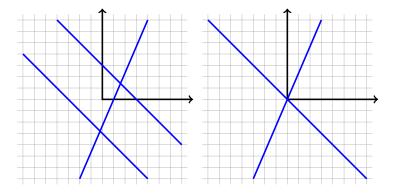

Figure: A semi-affine space and its direction

Presburger And Verification

MOVEP'10 39 / 68

イロト イポト イヨト イヨト

# Semi-Affine Encapsulation

#### Definition ([Ler04])

For any set  $R \subseteq \mathbb{Q}^d$  there exists a minimal for  $\subseteq$  semi-affine space that contains *R* called the **semi-affine encapsulation** of *R*.

#### Theorem ([Ler05])

Directions of semi-affine encapsulations of subsets of  $\mathbb{N}^d$  recognized by automata are computable in PTIME.

# Key Idea

Jérôme Leroux (LaBRI)

DQC

MOVEP'10 43 / 68

#### Theorem ([Ler05])

We can decide in PTIME if an automaton recognizes a Presburger set *S*. Moreover, in this case, we can compute in PTIME a Presburger formula  $\phi(\vec{x})$  that denotes *S*.

This algorithm is implemented in TAPAS [LP09].

- 3 Automata to Formulas

#### 5 Conclusion

- Th

# **Presburger Relations**

Let  $(x_1, x'_1, \dots, x_d, x'_d)$  be a sequence of distinct variables.  $\vec{x} = (x_1, \dots, x_d)$  $\vec{x'} = (x'_1, \dots, x'_d)$ 

#### Definition

A relation  $R \subseteq \mathbb{N}^d \times \mathbb{N}^d$  is said to be denoted by  $\phi(\vec{x}, \vec{x'})$  where  $\phi$  is a Presburger formula with  $var(\phi) \subseteq \{x_1, x'_1, \dots, x_d, x'_d\}$  if:

$$\boldsymbol{R} = \{ (\boldsymbol{v}(\vec{x}), \boldsymbol{v}(\vec{x'})) \mid \boldsymbol{v} \models \phi \}$$

In this case *R* is called a Presburger relation.

200

# Presburger Counter Systems

Definition

A Presburger counter system is a tuple  $(Q, d, \Delta)$  where:

- Q is a finite set of *control states*.
- $\Delta$  is a finite set of triples  $(q, \phi, q')$  where  $q, q' \in Q$  and  $\phi$  is a Presburger formula satisfying  $var(\phi) \subseteq \{x_1, x'_1, \dots, x_d, x'_d\}$ .

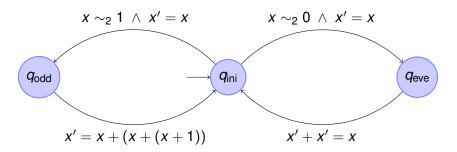

Figure: A Presburger counter system.

イロト イポト イヨト イヨト 二日

#### Semantics

A configuration *c* is a couple  $(q, \vec{n}) \in Q \times \mathbb{N}^d$ .

The semantics is given by  $(q, \vec{n}) \xrightarrow{\phi} (q', \vec{n'})$  if  $(q, \phi, q') \in \Delta$  and  $(\vec{n}, \vec{n'}) \in R_{\phi}$  where  $R_{\phi}$  is the Presburger relation denoted by  $\phi(\vec{x}, \vec{x'})$ .

# The Reachability Problem

We introduce  $\xrightarrow{*}$  defined by  $c \xrightarrow{*} c'$  if there exists:

$$c = c_0 \xrightarrow{\phi_1} c_1 \cdots \xrightarrow{\phi_k} c_k = c'$$

In this case c' is said to be *reachable* from c

With the Minsky machines:

Lemma

The reachability problem is undecidable for the class of Presburger Counter Systems.

# Inductive Invariant

#### Definition

A set  $C \subseteq Q \times \mathbb{N}^d$  is called an inductive invariant if for every  $c \xrightarrow{\phi} c'$  with  $c \in C$ , we have  $c' \in C$ .

#### Definition

A set  $C \subseteq Q \times \mathbb{N}^d$  is said Presburger if  $C = \bigcup_{q \in Q} N_q$  where  $N_q \subseteq \mathbb{N}^d$  is Presburger for every q.

200

# Symbolic Computation

Semi-algorithm deciding the reachability problem  $c_{\bullet} \xrightarrow{*} c_{!}$ .

Initially k = 0 and  $C_0 = \{c_{\bullet}\}$ . We repeat forever the following loop: If  $c_{!} \in C_{k}$  return "reachable". Compute:

 $C_{k+1} = C_k \cup \{c_{k+1} \mid \text{there exists } c_k \xrightarrow{\phi} c_{k+1} \text{ with } c_k \in C_k\}$ 

If  $C_{k+1} \subseteq C_k$  return "unreachable". Otherwise increment *k*.

イロト イポト イヨト イヨト 二日

# Acceleration Techniques

The iterative effect of cycles.

 $R_1 \cdots R_8$  is a Presburger relation denoted by  $\phi(\vec{x}, \vec{x'})$ .

In general even if R is a Presburger relation,  $R^*$  is not a Presburger binary relation.

We cannot even decide if it is definable in the Presburger arithmetic.

Jérôme Leroux (LaBRI)

Presburger And Verification

# Some Results

- Let  $f : \mathbb{Z}^d \mapsto \mathbb{Z}^d$  be a total linear function  $f(\vec{x}) = M\vec{x} + \vec{v}$ . Then  $f^*$  is definable in FO  $(\mathbb{Z}, +, 0, 1, \leq)$  if and only if  $M^*$  is finite [Boi03].
- Let  $f : \mathbb{Z}^d \mapsto \mathbb{Z}^d$  be a linear function partially defined over a Presburger set. Then  $f^*$  is definable in FO  $(\mathbb{Z}, +, 0, 1, \leq)$  if  $M^*$  is finite [FL02].
- Let  $\phi$  be a conjunction of difference constraints  $z_i z_j \le c$  with  $z_i \in \{x_i, x'_i\}$  and  $z_j \in \{x_j, x'_j\}$ . Then  $\phi^*$  is effectively definable in FO ( $\mathbb{Z}, +, 0, 1, \le$ ) [CJ98].
- Let  $\phi$  be a conjunction of octagonal constraints  $z_i z_j \leq c$  or  $z_i + z_j \leq c$  with  $z_i \in \{x_i, x'_i\}$  and  $z_j \in \{x_j, x'_j\}$ . Then  $\phi^*$  is effectively definable in FO ( $\mathbb{Z}, +, 0, 1, \leq$ ) [BGI09].

イロト イポト イヨト イヨト 二日

# Sometimes Approximation Is Mandatory

$$\vec{x'} = \vec{x} + (-1, 1, 0)$$
  $\vec{p}$   $\vec{x'} = \vec{x} + (2, -1, 0)$   
 $\vec{x'} = \vec{x} + (0, 0, 1)$ 

Figure: A Vector Addition System With States [HP76]

Reachability set from (p, (1, 0, 0))

$$\{p\} imes \{ \vec{n} \in \mathbb{N}^3 \mid n_1 + n_2 \le 2^{n_3} \}$$
  
 $\cup \{q\} imes \{ \vec{n} \in \mathbb{N}^3 \mid n_1 + 2n_2 \le 2^{n_3+1} \}$ 

Jérôme Leroux (LaBRI)

# Vector Addition Systems With States

#### Definition

A Vector Addition System with States (VASS) is a Presburger counter systems with formulas  $\phi$  of the form  $\vec{x'} = \vec{x} + \vec{v}$  with  $\vec{v} \in \mathbb{Z}^d$ .

#### Theorem ([Ler09])

If  $c_1$  is not reachable from  $c_{\bullet}$  then there exists a Presburger Inductive Invariant that contains  $c_{\bullet}$  but not  $c_1$ .

# Conclusion

We have seen:

- Some links between automata and Presburger arithmetic.
- Applications of the Presburger arithmetic on the verification of counter systems.

Many open problems:

- Find a decision procedure for the Presburger arithmetic combining efficiently formulas and automata.
- Improve acceleration techniques to be "complete" for the VASS reachability problem.
- Find interesting classes of Presburger formulas that can be iterated.
- And many other problems based on results not presented here.
